A fidget spinner is a small ball-bearing device that users can rotate between their fingers. It was originally seen as a device to help people who have attention deficit hyperactivity disorder, or ADHD. But many classrooms banned students from bringing in and using fidget spinners. So, students decided to try to construct their own fidget spinner using paper. "How to make a paper fidget spinner" became a top search in May, just in time for the end the school year in the United States.
