

[illegible]

But over the last few years the computer vision team over at Facebook has been working on making it possible to do this without dual-camera input. At last they succeeded, and this blog post explains, in terms technical enough that I'm not even going to attempt to summarize them here, just how they did it.

????????Facebook????????????????????????????????????????????????????????????????????????????????????

The advances mean that many — though not all — relatively modern single-camera phones should be able to use the feature. Google's Pixel series is now supported, and single-camera iPhones from the 7 forward. The huge diversity of Android devices makes it hard to say which will and won't be supported — it depends on a few things not usually listed on the spec sheet — but you'll be able to tell once your Facebook app updates and you take a picture.

????????????????????????????????????????????????????????????Pixel????????????????????????iPhone 7????????????????????????
